

# Captovation® Web Capture

## FEATURES:

- Minimal Software Installation
- Runs Within Browser
- TWAIN-Compliant
- Remote Database Linking
- Database Linked Pick-Lists
- Firewall Friendly
- Centralized Administration
- Auto-Populate Index Fields
- Rotate and Deskew
- Auditing of Remote Activity

## DISTRIBUTED, WEB-BASED CAPTURE

**Captovation Web Capture** lets you easily deploy browser-based document scanning and indexing at remote locations. Documents can be scanned and indexed at their place of origination allowing companies to realize these major business benefits:

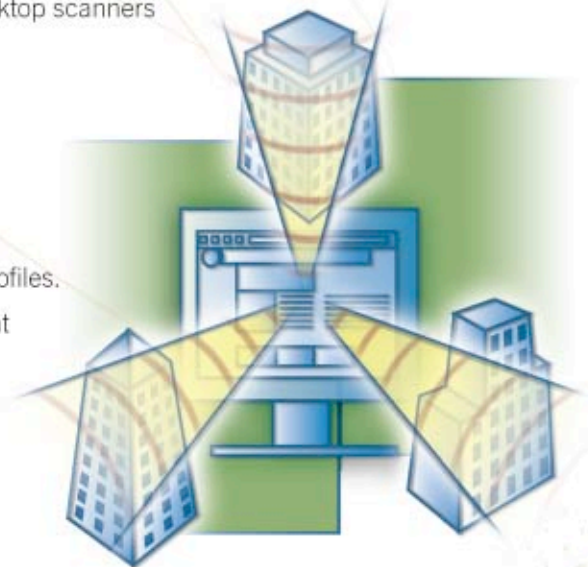

- Prevent lost documents between sites
- Reduce scanning requirements at central site
- Eliminate shipping costs
- Reduce labor costs
- Improve customer service

### Easy Deployment & Use

**Captovation Web Capture** requires no manual software installation at remote sites. The **Captovation Web Capture Client** is automatically downloaded and installed as soon as the user connects to the **Captovation Web Capture Server**. As a result, the remote capture sites will be up and running in no time. In addition, the **Web Capture Client** runs entirely within a web browser and uses the industry standard TWAIN interface to capture documents from desktop scanners or other TWAIN-compliant devices.

### Central Administration

The **Captovation Web Capture** system is administered through a web browser, allowing administrators to centrally configure scanning profiles. Scanning profiles define the method of document capture and associated settings. This ensures that remote sites adhere to standards set forth by the organization.

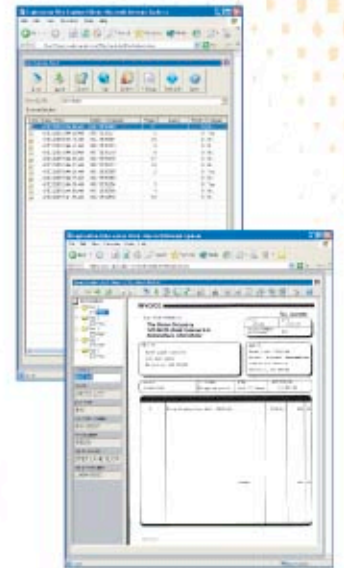

## Implementation Methods

**Captovation Web Capture** supports three remote capture methods:

1. *Scan only*
2. *Scan and index documents*
3. *Scan and index batches (groups of documents).*

If indexing of documents is allowed, scanning profiles will determine which document fields are available for remote indexing.

Our unique product architecture enables you to implement hybrid capture environments. For example, a company with many remote offices, such as an insurance company, can use **Captovation Web Capture** to scan claim documents at their remote offices, and then use **Captovation Index** to process the claim at their corporate headquarters. This eliminates shipping costs and helps improve overall customer service.

Captovation Web Capture User Interfaces

## Database Linking

**Captovation Web Capture** reduces data entry keystrokes and errors by allowing the indexing process to link to an external database and retrieve additional information. For example, a user can quickly search a corporate database by customer name to retrieve and auto-populate a customer account number field. If more than one record is found during this search, **Web Capture** will display a list and enable the user to select the correct database record. The **Web Capture Server** performs all database searching to provide a firewall friendly and efficient method to search corporate databases.

## Reliable Transmission

Reliable internet connectivity can vary between locations. **Captovation Web Capture** ensures document integrity when sending batches from remote sites to the **Web Capture Server**. Partial batch sending is avoided since all batch data (images and meta data) are transmitted in a single file to the web server. After batch transmission, the client verifies the receipt of the batch before removing it from the local workstation.

*Established in 1994, Captovation, Inc. specializes in the design and development of document and check capture products for the electronic document management industry. Our software products and custom integration services provide paper-intensive organizations the ability to streamline and tailor the document capture process to meet their needs.*

### Other Captovation Capture Products:

- *Scan (production-level scanning)*
- *Index (production-level indexing)*
- *Check Capture (check image and MICR capture)*
- *Recognition Server (automated document indexing)*
- *Import Server (universal document importing)*
- *Commit Server (efficient and reliable archiving)*
